

Backups & DR Planning

How long can your business afford to be down?

If your data is valuable, your backups are critical. ITX will assist you every step of the way to help you get your backup service up and running quickly.

- You can choose which files to back up, on what schedule, and how many versions you want to store for each file
- ITX monitors the status of each of your backups. If a potential problem is detected, an ITX technician initiates corrective action and proactively notifies you via e-mail or phone
- Industry-leading data encryption and security – 128-bit SSL encryption

ITX currently performs daily offsite **backups** of new data for myriad clients – from 1GB to 275GB. These clients are proactively protecting their mission-critical data and are confident that their data will be restored if the unlikely happens.

Disaster recovery is a very misleading name for one of the most important issues in business. It's **not** about recovering from a disaster. In fact, it's just the opposite. Your company must **continually plan** and manage the business continuity & disaster recovery processes.

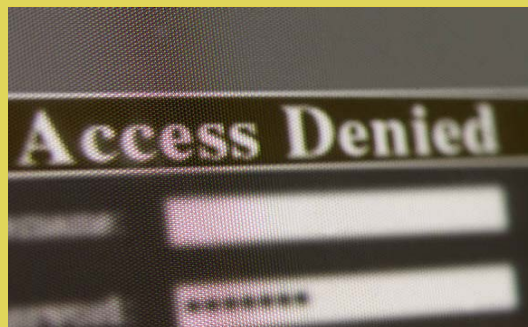

This involves up-to-date technology and well-informed IT analysts who will implement your disaster recovery plan.

ITX can assist with your:

- business continuity planning
- risk analysis
- data backups & retrieval

Potential threats to your data:

Hackers/cyber crime
Viruses & worms
Natural disasters
Loss of utilities
Equipment failure
Sabotage or terrorism
Angry employees
Computer theft
Human error
File corruption
Accidental deletion
Faulty tape storage
